**Subject:** Extra sampling for March/April?

Happy Monday, All,

Wondering if there is interest/\$ out there for replicating the same extra data that Buck and I worked on last year to catch the flush and pre-flush. We took many additional Riverwatch samples (including diurnal) at A55 and A68 for 6 weeks in March and April, and I believe Dan made the graphs from that data. We are coming up on the time when we need to plan this if we do want it. Buck and I have talked about it and we are happy to grab and process the samples. Peter Butler and I have also talked about it and he is not so sure it is really necessary but is thinking on it.

Questions:

~Sippers should capture this same info, assuming they work correctly and are there for retrieval. But, what if they don't?

~Is there \$ for this?

~Is there additional data that could make this more meaningful? Happy to get it.

~If it would be more helpful for data to meet EPA critiria and EPA wants to pay for it, could we use same process I am using for Q&A samples?

~We are on a serious warming trend. We only had one cold snap this year at the very earliest part of the winter. Is pre-flush going to happen earlier this year? Who knows but worth thinking about.

So I am good with doing these samples or not but I did want all to ponder.

Thanks.

Lisa
